**Finite field restriction estimates based on Kakeya maximal operator estimates.**  (English)  

Summary: In the finite field setting, we show that the restriction conjecture associated to any one of a large family of \( d = 2n + 1 \) dimensional quadratic surfaces implies the \( n + 1 \)-dimensional Kakeya conjecture (Dvir’s theorem). This includes the case of the paraboloid over finite fields in which \(-1\) is a square. We are able to partially reverse this implication using the sharp Kakeya maximal operator estimates of J. S. Ellenberg et al. [Mathematika 56, No. 1, 1–25 (2010; Zbl 1189.42010)] to establish the first finite field restriction estimates beyond the Stein-Tomas exponent in this setting.

**MSC:**

- **42B10** Fourier and Fourier-Stieltjes transforms and other transforms of Fourier type
- **42B25** Maximal functions, Littlewood-Paley theory
- **14G15** Finite ground fields in algebraic geometry
- **52C17** Packing and covering in \( n \) dimensions (aspects of discrete geometry)
- **11T24** Other character sums and Gauss sums

**Keywords:**

- Fourier transform; restriction conjecture; Kakeya conjecture; finite fields
